If you ever had to create an image of your entire hard disk, you'll know just how tedious and time consuming the process can be, especially if the whole drive is hidden in an inconspicuous internal part, such as the USB drive. At this point you'll be wondering what a so-called 'Virtual Clone Drive' is all about, and if it could actually make your life easier. At the simplest, a VCD drive allows you to create a virtual copy of a hard disk, so that all information is saved directly to the right disk drive and

---

you can restore this duplicate from any computer. Sounds great, but of course, at the same time it does have its flaws. With such drives, you'll have to format the source disk, while it will be required to choose a specific section of the disk to be duplicated, as well as selecting the disk size. Virtual CD Creator is a program that works exactly the same way, as it let you create a VCD drive with ease, just by dragging and dropping files and folders to the virtual CD drive. And unlike a normal VCD drive, which you'll have to manually burn the image of

---

the hard disk to a physical CD, Virtual CD Creator will let you simply burn the data to the CD, without even having to worry about any structure, or how much space the hard disk should have to fit all the files to it. Just drag and drop any files and folders to the virtual CD drive and let Virtual CD Creator do the rest of the work. The interface is a bit dated, but still works very well, and the VCD drive generated by this app is extremely easy to use, and even has an option that lets you automatically mount the virtual CD drive as an external drive.

---

Unfortunately, Virtual CD Creator doesn't offer any options to choose the source drive, nor it lets you select the data to be duplicated to the virtual CD drive. Like most software that tries to be a VCD and CUE burner, Virtual CD Creator requires a constant Internet connection.
