Download the latest version of the VSCO Cam App from the App Store for iOS. Install the Google Chrome Portable @ .Q: Why does the GetHashCode() method in System.Security.Cryptography.Rfc2898DeriveBytes not produce the same hash code as the text of the password? I was reading through this and in the CryptoStreamReciever we see: // create a new password hasher. Rfc2898DeriveBytes password = new Rfc2898DeriveBytes(passwordToObtain, new byte[32]); then later we do this: stream.Seek(0, SeekOrigin.Begin); I have a few questions. The documentation says that the password parameter may only be 10 characters in length. Then why does the hash code for the password retrieved here be shorter than what is used in the original function call? Rfc2898DeriveBytes password = new Rfc2898DeriveBytes(passwordToObtain, new byte[32]); Why is the value I am deriving a hasher the value of an SHA-512 based hash and not a HMAC hash? The documentation says it is 8 bytes long, but when I view the bytes it is 32 bytes long? Why are the bytes for this hasher not exactly 16 bytes long like the original hasher given to the constructor? The encryption class used appears to be RijndaelEncryption which is a block cipher not a HMAC. Here is how I decrypted: // cipher = 8192 bytes // hexa decoder = 4096 bytes byte[] cipher = Decrypt(cipher, new byte[4096]); And in the Decrypt method: public byte[] Decrypt(byte[] cipher, byte[] keyBytes) { if (cipher == null) throw new ArgumentNullException(nameof(cipher)); if (keyBytes == null) throw new ArgumentNullException(nameof(keyBytes)); // Setup the RijndaelManaged object using (var rijAlgorithm = new RijndaelManaged()) { rijAl
