Field of the Invention The present invention relates to an apparatus for detecting a speech signal from an input audio signal and, more particularly, to a speech detecting method and apparatus which are capable of detecting a speech signal even when the input audio signal includes a background noise. 2. Description of the Related Art In recent years, progress has been made in speech recognition technology. The technology of speech recognition is generally classified into two groups: one group, typified by a Dragon Dictate system, is so designed that audio data representing a voice spoken by a user is accumulated in a memory device and recognition of a document then is performed by referring to the accumulated data; the other group is so designed that recognition of the voice is performed by analyzing the frequency and/or spectral power of the input audio signal. One of the problems with speech recognition is that a document must be inputted into a mainframe before recognition of the document is performed. Another problem is that the audio data representing the voice should be stored in a memory device for the purpose of speech recognition. One of

the typical techniques for solving these problems is disclosed in U.S. Pat. No. 5,231,670. In the above patent, a waveform representing a waveform shape of a speech sound is obtained by extracting a predetermined parameter from a time series value of an input audio signal. The obtained waveform is compared with a stored waveform in advance. Thereby, determination is made as to whether the input audio signal represents a speech sound or not. In Japanese Patent Unexamined Publication No. 2-20945, there is disclosed a technique in which a speech signal is detected by using an adaptive threshold. More specifically, an audio signal subjected to filtering is divided into frames, each of which is defined as a block of sample data or a block of threshold value data. A candidate pulse is identified by referring to a waveform of the audio signal. A threshold level for the speech signal is determined by comparing the number of candidate

A: For reading, you can use the Registry class. For writing, you can use the Registry API. A: for those of you looking for a solution for windows, here is a link of mine with registry, on the MAC its very much the same! A variety of different tools have been devised and are being used to support three dimensional printing, also known as additive manufacturing. Three dimensional printing permits the manufacture of custom-made parts by the sequential assembly of successively formed layers of ink, paste or other materials. Three dimensional printing technology has a wide range of potential applications, including producing parts and prototypes for research and development, producing parts for

short run manufacturing, producing parts for art, architecture, industrial design, and even making spare parts. There are different types of printers, such as inkjet printers, extrusion printers, powder bed printers, and selective laser sintering printers. Each of these printers has unique attributes and capabilities, and each is suitable for

headline declaring “cryptocurrency’s biggest day of the year.”
After a banner year in 2017, 2018 is seen as the year
cryptocurrency prices take off. Some are just guessing what
will happen, but this has been a volatile and unpredictable
market. In a way, it is reminiscent of the stock market in the
roaring '80s, where the era of dot-com stocks took off.
Cryptocurrencies are here to stay in 2018 Like the tech

companies at the heart of the dot-com boom, the promise of new technology, usability, and even ways to avoid taxation will continue to spur growth in cryptocurrency adoption and usage. This year, most will enter the market as investors, as opposed to investors who needed their assets for trade. The only real threat to cryptocurrencies in 2018 will be the moneyed elite, which want to preserve their monopolistic monopolies. Bitcoin and cryptocurrency in 2018 Bitcoin dominance is going
