My question is: In Java, how do you access a class's variables that are declared as static? Example: public class MyClass { static String PROP = "PROP"; } public class MyClassTest { public static void main(String[] args) { // How do you access the variable 'PROP' here? } } A: Your static members are public, so you can access them from the public interface of the class: String MyClass.PROP; But that has nothing to do with public versus private. You can't access private members from another class, for instance. A: Try public static String PROP = "PROP". A: You can also access them inside a static method - though, according to the documentation, The only access to static members in a method is via a Class.staticMethodName call, or via a static initializer. so if you do not use a static initializer or static method, you have no access.
