Ecs H61h2-mv Driver

ECS, Elitegroup Computer Systems, founded in 1987, is a premier manufacturer and supplier of several families of computer products to the industry. . Elitegroup offers high performance motherboards, graphics and desktop and desktop processors, storage systems, audio, video and networking products, and everything for peripherals. Elitegroup is the market leader in terms of quality, performance, usability and overall reliability. Elitegroup is proud to be one of the leaders in motherboards, graphics cards, desktops, PCs, desktops, PCs, audio, video and networking.

Ecs H61h2-mv Driver

ECS eDLU utility makes updating drivers fast and easy. Ecs (Elitegroup) H61H2-MV motherboard firmware update H61H2MV. From this page you can download the latest ECS (Elitegroup) H61H2-MV motherboard bios version.1. Field of the Invention The present invention relates to an image processing apparatus which extracts correlation between image data and a region to be extracted from the extracted image data as a feature value to perform pattern recognition by using the extracted feature value. 2. Related Background Art Conventionally, there has been proposed a system for reading out a still image such as a stored photograph to convert the read out image into an electronic image data and detecting a specific person by performing pattern recognition on a face from the electronic image data. For example, in the case where a person is to be detected from an electronic image data, when a specific person is out of focus in a face of a still image, a face pattern of a person in focus is extracted as a feature value from an electronic image data. The feature value is compared with a feature value of the specific person, which is registered as a characteristic pattern, thereby detecting the specific person from the electronic image data. In the case where the specific person to be detected is out of focus in the face of the stored image, the face pattern of the specific person tends to be reduced in size. Therefore, if a face region is extracted in the same manner as in the case of the stored image, the face region sometimes includes a region which corresponds to a portion of the specific person to be detected with a high probability. Thus, there has been considered a method for performing pattern recognition by setting the face region as an image on the assumption that the specific person is out of focus. However, even if the face region is set, a characteristic pattern extracted from a detected face region of a specific person tends to have a low degree of similarity with a characteristic pattern of the specific person, making it difficult to perform pattern recognition. In contrast, a characteristic pattern extracted from a face region of another person tends to have a high degree of similarity with a characteristic pattern of the other person.

For this reason, there have been known a process for performing pattern recognition by extracting a feature value (or a characteristic pattern) of a person's face region by an optimum method, such as a pattern matching method (for example, see Japanese Patent Application Laid-open No. 60- c6a93da74d
